Code of Conduct

Assignment Description:

As a team we have to create a Java application which is a note taking app. This application should minimally meet the Basic Requirements and we aim to have at least a week before the deadline to implement extensions. In the words of Lucas & Yoanna, “Aim for the skies”, our **target achievement level** is to get a 10 on this project, this gives leeway in our result. Everything we need to do must be on time!

Attendance:

a. We have the following team meetings where absence needs to be notified:
    i. **TA Meetings** on Wednesdays at 13:45 in Drebbelweg Hall 1, C6
    ii. Team meetings on Friday at 9.30 where we plan the **next milestone** and distribute all the tasks for it.
b. Snack rule - if you’re late to a meeting by 10 minutes, you must bring snacks at the next meeting.
c. Outside of meetings in person, we will communicate on Whatsapp and Mattermost. On Whatsapp we will ask general questions that we may have and we will use Mattermost to communicate with our TA.

Planning:

Our team wants to implement a “all for one, one for all” strategy, thus we are going to implement the following ideas:

a. **Knockout Criteria:** Write an update about progress on knockout criteria every Wednesday and Saturday. Each sunday by 4pm, everybody has to send a message on whatsapp group that they are done with their weekly mandatory tasks (100 lines of code, commits). If they forget to send a memo, they should expect to be spammed by team members.
b. If someone struggles to finish a task, they should send a message on Whatsapp as soon as possible, the group should collectively try to help them.
c. Șerban is going to submit the final repository and the Code of Conduct to the git repository.

Work Quality:

a. **Readability:** When a task is done, it should be checked by all team members and it should have no Checkstyle errors. We will use the same Checkstyle that was used in Introduction to Programming in the first quarter.
    i. **Commits:** The commit names should be short and specific. Max. 3 changed files and 200 lines of Java code.
    ii. **Branches:** Issues, branches and MRs for the same feature can have the same name and should correspond to each other.
    iii. **GitLab features:** Each issue must have labels, assignees, time tracking, and a milestone assigned.

b. Merging: Before merging to the main branch, the code written in the separate branch should compile and pass all the previous work quality specifications. Before merging anything to the main branch, everyone should look at the changes made and send a comment on the MR. Only after the entire team has left a comment should the merge be made. No rebasing and no squashing allowed!
    i. If there has been 1 day without any activity on a feature branch, the person that notices will do the review themselves.

Conflict:

When dealing with conflict, our first step is to try and reach a consensus by ourselves. If this does not work we will approach our TA who will advise us on whether we need to escalate the matter to lecturers or other third-parties.

a. We will make decisions using a discussion method and if we don't reach a consensus by the end of the meeting time, then we will table it to do first thing in the next meeting. However, if after two meetings no progress is made, we will **contact our TA.**
b. If a team member is not following the Code of Conduct in terms of participation, we will **contact our TA** and ask for advice on how to handle the situation. This includes, being late or missing multiple meetings, not meeting the weekly knockout requirements, not contributing enough code, etc.
